any difficulties that you encountered
- We're unable to implement fitbound for the map, so we're debating on removing the zoom feature
  - Decided to remove the zoom in and out feature to make sure that users can always see everything on one page
  - Always show the entire Cambridge map for search results
- Failed GET request, always return 304 and failed to update frontend
  - We would send an email to Emily about the details about which get/post are not working and try to figure out why they are not working
- Getting random errors that appear with success message, failed to find the bug
  - We will try to find where the errors are added and whether they are from the function or not. This may give some hints on why the errors are occuring
  - We will also include this error in the email to Emily

Daniel mentioned that our covid rating might lead to some conflict?
- There is only one covid rating, so it is unclear which specific part of covid users are giving ratings to
- Talked about having separate textboxs for each rating, but later decided not to choose this one because it can make the ratings confusing.
- Decided to provide examples to the users in the placeholder to better explain the purpose of covid rating
- We also decided to make the comment of ratings mandatory (same as now), so that users can explain the reason of their ratings

Discussion: Talk about the difficulties and check if any improvements can enhance the project

For Finished Project, Emily suggested spending more time on polishing the frontend and ensure a better user experience. We would prioritize this over implementing functionalities. We can look at the feedbacks to our MVP to see how we can improve it.
